Goal and Idea

PostgreSQL Run-Time Parameters

- work_mem
- effective_io_concurrency
- temp_buffers
- maintenance_work_mem
- ...

Preparation

1. Find Suitable Parameters in PostgreSQL 9.6

- 261 run-time parameters, including
 - 25 for query preparation
 - 12 for query execution
- Sampling-based profiling
- Pre-select best parameter candidates with SARD [1]

2. Find Suitable Tuning Section

- Profiling ~600 KLOC with
 - Database benchmark: TPC-H
 - Instruction-based profiling

3. Attach Autotuner

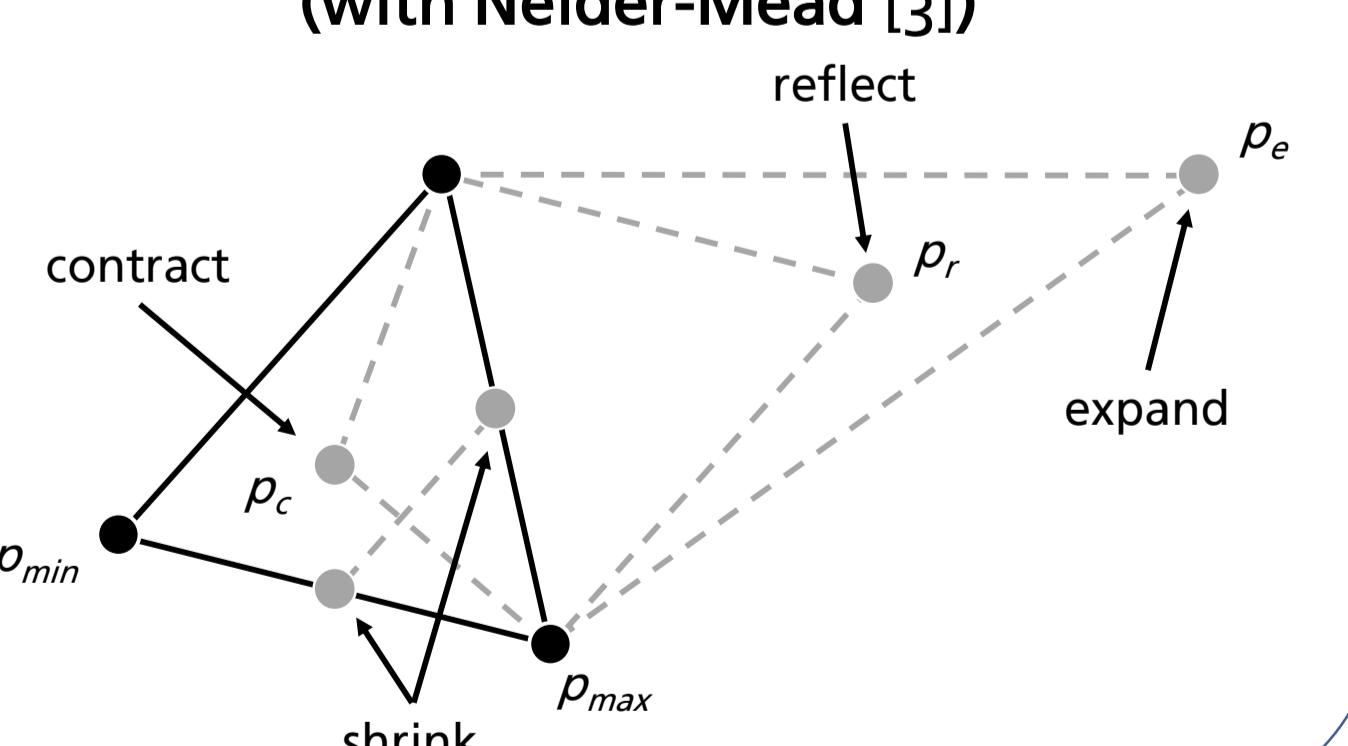

```

For each tuning parameter tp:
tp_config = (struct config_int *)
  find_option("tp_name", false, ERROR);
ctuner_register_parameter(myTuner,
  tp_config->variable,
  minval, maxval, step);

(Pseudocode for using AtuneRT [2].)
  
```

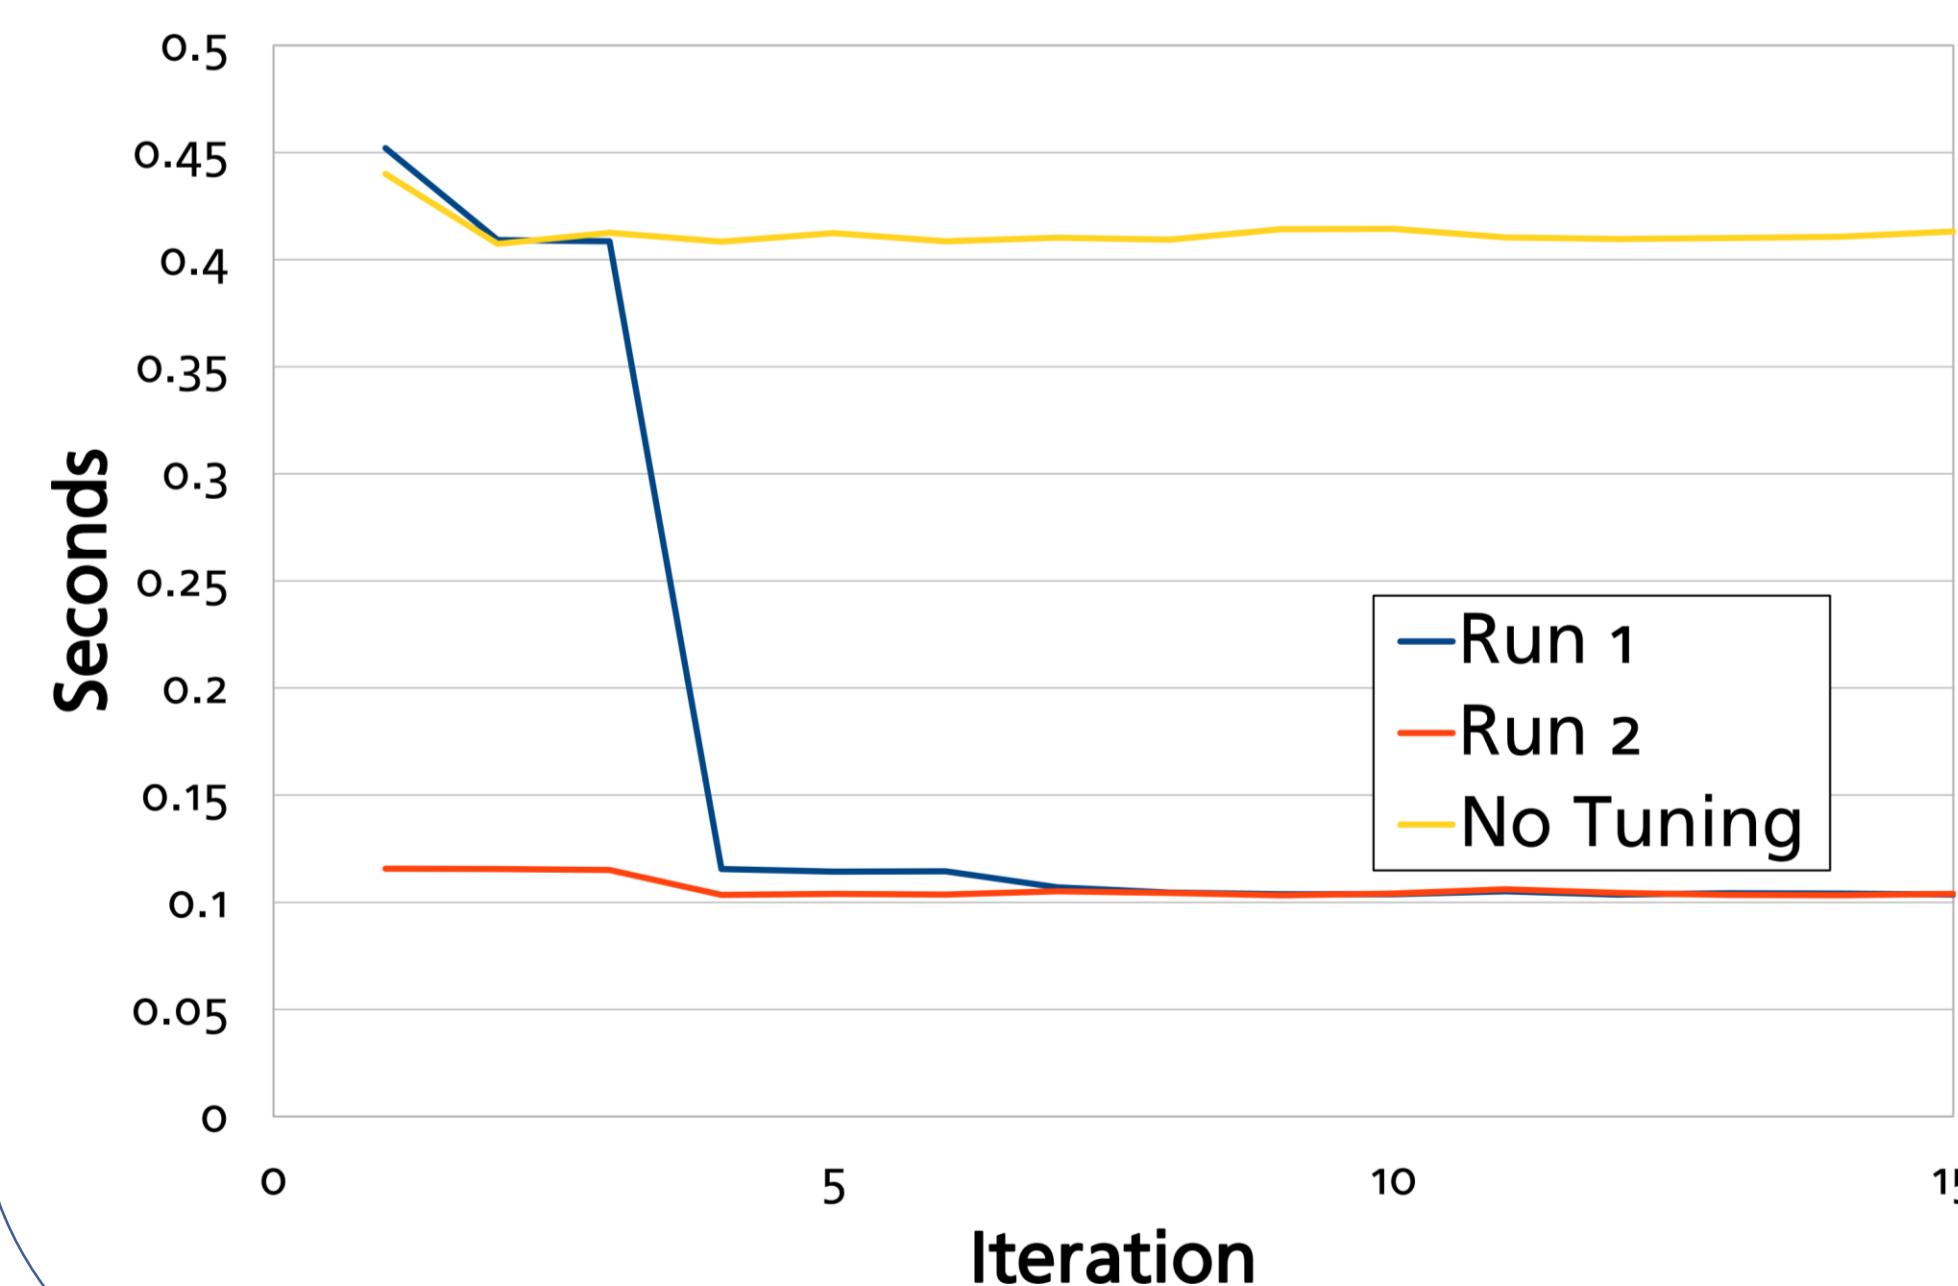

Execution and Results

4. Search-based Optimization (with Nelder-Mead [3])

5. Performance Improvement by Iteration

Example: Query #3 from TPC-H [4]

6. TPC-H Results

Query	#Iterations	Gain
1	145	0.997
3	15	3.905
5	5	1.012
7	35	0.995
8	150	0.968
9	205	0.977
10	35	0.902
11	40	0.908
13	35	0.636
14	5	1.057
15	10	1.012
17	300	1.086
18	150	1.095
20	20	1.018
21	90	1.004
22	35	0.935
